

CLAIMS

1. A method of dosing reinforcing fibers in a mixing silo during the manufacturing of fiber concrete, comprising:

5                   a) supplying concrete reinforcing fibers in a chain packing of sacks, the sacks being made of a material which can be disintegrated in one of mortar and concrete.

2. Method as in claim 1, wherein:

10                  a) the chain packing includes a strip connecting the sacks.

3. Method as in claim 2, wherein:

15                  a) the strip is made of a material which can be disintegrated in one of mortar and concrete.

4. Method as in claim 1, wherein:

20                  a) the reinforcing fibers are arranged in the sacks in a substantially mutually parallel position.

5. Method as in claim 1, wherein:

25                  a) a length of the respective reinforcing fibers corresponds substantially to the respective lengths of the sacks; and

                      b) the reinforcing fibers are situated lengthwise in the respective sacks.

6. Method as in claim 1, wherein:

- a) a length of the respective reinforcing fibers corresponds substantially to the respective width of the sacks; and
- 5 b) the reinforcing fibers are situated widthwise in the respective sacks.

7. Method as in claim 1, wherein:

- a) the sacks are joined in a line.

10

8. A method for dosing reinforcing fibers in a mixing silo during manufacturing of fiber concrete, comprising:

- 15 a) supplying the fibers in a chain packing of sacks;
- b) cutting open the sacks a sufficient amount and above the mixing silo so that the reinforcing fibers fall out of the sacks into the mixing silo; and
- c) conveying away the cut open chain packing.

20

9. Method as in claim 8, wherein:

- a) the sacks are joined to each other.

10. Method as in claim 8, wherein:

- 25 a) the reinforcing fibers are arranged in the sacks in a substantially mutually parallel position.

11. Method as in claim 8, wherein:

a) a length of the respective reinforcing fibers corresponds substantially to the respective lengths of the sacks; and

5 b) the reinforcing fibers are situated lengthwise in the respective sacks.

12. Method as in claim 8, wherein:

a) a length of the respective reinforcing fibers corresponds substantially to the respective width of the sacks; and

b) the reinforcing fibers are situated widthwise in the respective sacks.

15 13. Method as in claim 8, wherein:

a) the sacks are joined in a line.

14. A chain packing for use in a method of dosing reinforcing fibers in a mixing silo during the manufacturing 20 of fiber concrete, the chain packing comprising:

a) a plurality of sacks; and  
b) the plurality of sacks being filled with concrete reinforcing fibers.

25 15. Chain packing as in claim 14, wherein:

a) the plurality of sacks is made of a material which can be disintegrated in one of mortar and concrete.

16. Chain packing as in claim 14, wherein:

- a) the sacks are joined to each other.

17. Chain packing as in claim 14, wherein:

- 5
- a) the reinforcing fibers are arranged in the sacks in a substantially mutually parallel position.

18. Chain packing as in claim 14, wherein:

- a) the reinforcing fibers are made of steel.

10

19. Chain as in claim 14, wherein:

- a) a length of the respective reinforcing fibers corresponds substantially to the respective lengths of the sacks; and
- b) the reinforcing fibers are situated lengthwise in the respective sacks.

15

20. A method for dosing reinforcing fibers in a mixing silo during manufacture of fiber concrete, comprising:

- 20
- a) supplying the concrete reinforcing fibers in a chain packing of sacks;
  - b) cutting open the sacks a sufficient amount and above the mixing silo so that the reinforcing fibers fall out of the sacks into the mixing silo; and
  - c) conveying away the cut open chain packing.

25

21. Method as in claim 20, wherein:

- a) the sacks are joined in a line.
